Clinical Note — Office Visit 10/28/2026

Patient: Casey Morgan DOB 07/02/1985

History

41-year-old with right knee pain for about 9 weeks after a twisting injury. Reports catching and intermittent swelling. States they attended physical therapy 'for several weeks' at an outside clinic. Taking ibuprofen 600 mg as needed.

Imaging

Right knee X-ray 09/05/2026: no fracture, joint spaces preserved.

Exam

Medial joint line tenderness. McMurray test positive medially. Mild effusion. Ligaments stable (Lachman and drawer negative).

Assessment / Plan

Suspected medial meniscus tear, right knee. Request MRI knee without contrast. PT records requested from outside clinic; not yet received.
